

ReIMS Invent

Optional Module for ReIMS (

Enterprise

Edition)

Jobs that have been won are automatically transferred by ReIMS to the ReIMS Invent software hosted on the PocketPC of the mover/removalist.

Overview

All the inventory details captured at initial survey are transferred to ReIMS Invent. The mover checks each item in this room by room inventory as they are loaded for shipment. The condition of each item is marked using a configurable dropdown list. Photographs may be taken of any special items directly on the PocketPC device and linked to the inventory item. This aids greatly in resolving insurance claims for transit damage.

Upon completion of the loading of shipment, the updated inventory information is synchronised remotely with the ReIMS central server.

Features

- Inventories are already created from your ReIMS estimate.
- Simply click on the item from the quote to record condition.
- Reduce claims with typed inventory conditions and attached pictures of existing damage.

System Requirements

PocketPC running the Windows Mobile 5 operating system
